AWS Lambda

- AWS Lambda is a serverless compute platform launched by Amazon Web Services in April of 2014.
- It was the first service that provided this model of hosting and now has spawned a whole industry of functions as a service:
- Vercel, Netlify, Heroku (based on AWS Lambda),
- Google Cloud Functions, and Azure Functions (alternatives)
- Has integration with other AWS services such as DynamoDB and S3 storage buckets.

Core Principals

The background of the slide features a series of soft, flowing, organic shapes in shades of light blue, lavender, and pale pink. These shapes overlap and blend into each other, creating a sense of movement and depth. The overall aesthetic is clean, modern, and calming.
